

**Add oxygen.
Fire up your profits.**

Let us add oxygen to your kiln and watch your profits heat up. Whether you're trying to increase production or lower your fuel costs, oxygen injection can help. Oxygen enhances the combustion of all fuels, enabling improved burning zone control, lower emissions, and greater kiln stability. Just ask our many satisfied customers. For over 10 years, we've helped them increase clinker production by 5-30% and alternative fuel utilization by 30-80%. Our unparalleled experience with all types of kilns (wet, long dry, preheater, precalciner) and our proprietary technology have enabled our customers to maximize the benefits of oxygen enrichment. And more importantly, to maximize their profits.
