

**Oxygen makes
alternative fuel burn
so consistently,
you'll swear it's coal.**

Enrich your kiln with oxygen and you'll be able to burn alternative fuels more consistently and at a higher flame temperature. Our proprietary enrichment technologies improve your control of the burning zone, reduce emissions, and increase kiln stability. By adding oxygen, you can increase your current fuel substitution rates by 30 to 80%, maintain or increase production, and lower your operating costs. Installing a system is an easy retrofit, with minimal capital investment.

Air Products' experience can inject a breath of fresh oxygen into your sustainability initiatives. To make alternative fuels burn the way you want, add our know-how and oxygen. For free case studies and more information, visit airproducts.com/kiln.
