Welcome to your CDP Climate Change Questionnaire 2020

C0. Introduction

C0.1

(C0.1) Give a general description and introduction to your organization.
At Air Products, we understand that a thriving society and healthy planet are inextricably linked. We see ourselves at the heart of one of the greatest global challenges today -- meeting the world’s need for clean, sustainable energy. Energy that protects our environment and moves us all towards a better future. That is why at Air Products, we are driven by an important ambition: to innovate alongside our customers to help make them more sustainable.

We supply our customers around the world with atmospheric gases (oxygen, nitrogen, argon and rare gases), process gases (hydrogen, helium, carbon dioxide, carbon monoxide, syngas), specialty gases, and equipment and services relating to the production or processing of gases. Our products are critical for scores of industries to advance their sustainability efforts and to make products that serve their customers and consumers. From energy to electronics, metals to manufacturing and chemicals to construction, our products enable economic opportunities for our customers.

Our products also enable our customers and downstream users to avoid emissions of carbon dioxide (CO2). In 2019, 69 million metric tons of CO2e* were avoided by the use of our products, equivalent to the emissions from 15 million cars and 2.5 times our own total direct and indirect CO2e emissions.

Air Products also develops and deploys technology for the world to meet its energy and productivity needs. As we look forward, we see significant opportunities for gasification, carbon capture technologies and hydrogen for mobility and energy transition. We are actively engaged in these industries that we believe will help solve today’s and tomorrow’s energy and environmental challenges.

In addition to supporting our customers, we are committed to improving our own environmental performance by operating safely and efficiently, incorporating environmental considerations into the design of our facilities and products, effectively managing environmental risks and communicating our results. Industrial gas manufacturing is energy intensive. Air separation requires electricity or steam to compress air so that it can be cryogenically distilled into oxygen, nitrogen and argon. Likewise, the primary method to produce large volumes of hydrogen consumes natural gas, and in some cases, refinery off-gas. Most of our Scope 1 emissions are related to the energy we consume in hydrogen production, while our Scope 2 emissions are largely due to the energy we consume for air separation. Our Scope 3 emissions are related to the fuels we consume, the use of our products and our investments.
For nearly 80 years, Air Products has enabled its customers to become more productive, energy efficient and sustainable. With fiscal 2019 annual revenues of $8.9 billion, operations in more than 50 countries, and more than 17,000 employees, we strive to build lasting relationships with our customers and communities based on understanding, integrity and passion. Our corporate headquarters are located in eastern Pennsylvania’s Lehigh Valley, near Allentown; European headquarters are in Hersham, near London, England; South American headquarters are in Santiago, Chile; and Asian headquarters are in Shanghai, China.

This is Air Products’ 18th consecutive response to CDP’s climate change information request. Our emissions reporting period is January 1, 2019 to December 31, 2019.

*CO2e or carbon dioxide equivalent is a standard unit for measuring carbon footprints that considers the different global warming potentials of GHGs.

**C0.2**

<td>Board-level committee</td>
<td>Air Products manages sustainability through an interdisciplinary approach. Air Products' Board of Directors has accountability for oversight of environmental and safety performance, which it reviews at least quarterly. The Corporate Governance and Nominating Committee of the Board of Directors has responsibility for monitoring our response to important public policy issues, including sustainability, which the Committee reviews on a regular basis. Air Products’ Chairman, President and CEO has leadership responsibility for the development and execution of the company’s sustainability strategy. An example of a recent climate-related decision led by the CEO and under the oversight of the Board of Directors was Air Products’ agreement with ACWA Power and NEOM for a $5 billion world-scale green hydrogen-based ammonia production facility powered by renewable energy. The project, which will be equally owned by the three partners, will be sited in NEOM, a new model for sustainable living located in the northwest corner of the Kingdom of Saudi Arabia. The joint venture project is based on proven, world-class technology and will include the innovative integration of over four gigawatts of renewable power from solar, wind and storage; production of 650 tons per day of hydrogen by electrolysis using thyssenkrupp technology; production of nitrogen by air separation using Air Products technology; and production of 1.2 million tons per year of green ammonia using Haldor Topsoe technology. Air Products will be the exclusive off-taker of the green ammonia and intends to transport it around the world to be dissociated to produce green hydrogen for the transportation market.</td>

C1.2a

(C1.2a) Describe where in the organizational structure this/these position(s) and/or committees lie, what their associated responsibilities are, and how climate-related issues are monitored (do not include the names of individuals).

Climate change and related issues are reviewed by the following levels of the organizational structure that are described below in more detail:

- The Board of Directors
• The Corporate Governance and Nominating Committee of the Board of Directors
• Air Products' Chairman, President and Chief Executive Officer
• The Sustainability Leadership Council, which is chaired by the Vice President Investor Relations, Corporate Relations and Sustainability
• Regional businesses and environmental experts
• The Sustainability Team

Air Products’ Board of Directors has accountability for oversight of environmental and safety performance, which it reviews at least quarterly. Risk assessment and management is overseen by the Board of Directors. Climate-related risks and opportunities are routinely reviewed and reflect the Board’s input.

The Corporate Governance and Nominating Committee of the Board of Directors has responsibility for monitoring our response to important public policy issues, including sustainability, which the Committee reviews on a regular basis.

Our Sustainability Leadership Council sets our sustainability strategy, reviews programs and performance, and is engaged in evaluating risks and opportunities related to climate change. The Council is chaired by the Vice President Investor Relations, Corporate Relations and Sustainability, who reports to the company’s Chief Financial Officer (CFO). The CFO reports to the Chairman, President and Chief Executive Officer of Air Products. Additional members of the Council include:

• Chief Operating Officer
• Executive Vice President and CFO
• Executive Vice President, General Counsel and Secretary
• Senior Vice President, Chief Information Officer and Special Advisor to the Chairman
• Senior Vice President and Chief Human Resources Officer
• President, Europe and Africa
• Vice President, Corporate Communications
• Vice President, Hydrogen for Mobility
• Vice President, Large Project Business Development – CO2 Solutions
• Executive Director, Technology
• Director, Operational Excellence
• Director, Sustainability

The Sustainability Leadership Council Chairman and Sustainability Director report on sustainability progress to the Corporate Governance and Nominating Committee at least annually.

Regional environmental experts identify and review risks (transitional and physical) related to climate change and communicate risks to potentially impacted businesses. The businesses work with environmental experts and Government Relations personnel to develop and execute strategies to address climate-related risks. Regional environmental experts report through the regional businesses, and Government Relations team members report to the Vice President Investor Relations, Corporate Relations and Sustainability.
The Sustainability Team, comprised of the Sustainability Director and staff, supports all aspects of sustainability including climate change and reports to the Vice President Investor Relations, Corporate Relations and Sustainability.

This structure enables the communication and review of climate related risks and opportunities through management and across the company.

**C1.3**

(C1.3) Do you provide incentives for the management of climate-related issues, including the attainment of targets?

<table>
<thead>
<tr>

</tbody>
</table>
C2.1b

(C2.1b) How does your organization define substantive financial or strategic impact on your business?

Air Products defines substantive risks as those risks that could have a material, adverse effect on the company’s business, operating results or financial condition. Material effects are identified in accordance with the U.S. Securities and Exchange Commission’s definition for materiality. Substantive risks are reported each year in Air Products’ Annual Report on Form 10-K and material changes to these risks are reported as needed in Air Products’ Quarterly Reports on Form 10-Q. Key risk factors related to greenhouse gases (GHGs) and climate change that were reported in the 2019 Annual Report included:

1. legislative, regulatory and societal responses to global climate change;
2. potential interruptions in energy supply;
3. costs and expenses resulting from compliance with environmental regulations; and,
4. catastrophic events that could disrupt operations, suppliers or customers.

These risks are quantifiable and described in Air Products’ response to question C2.3a (below). Air Products estimates that the potential financial impact is $200 million for the first three risks and $10 million for the fourth risk, respectively.

C2.2

Description of process

We use a multi-disciplinary approach to identify, assess and manage risk, including climate-related risks. In addition to the processes described below, we review climate-related developments and the need to assess specific climate risks as part of our internal audit program. We also incorporate climate-related risks into annual financial reporting, defining substantive risks as those risks that could have a material, adverse
effect on the company’s business, operating results or financial condition in accordance with the U.S. Securities and Exchange Commission’s definition for materiality.

Identifying and assessing climate-related risks
Regional environmental experts identify and review risks (transitional and physical) related to climate change and communicate risks to potentially impacted businesses.

Transitional risks for our direct operations are primarily related to new and/or modified regulations linked to climate change, such as emissions trading systems and carbon pricing mechanisms. Although uncertain, these developments could increase our costs related to consumption of electric power and hydrogen production and application of our gasification technology. Any legislation that limits or taxes GHG emissions could negatively impact our growth, increase our operating costs, or reduce demand for certain of our products. We aim to mitigate most of the increased costs through contractual terms.

Physical risks are identified and assessed for existing facilities and new facilities. This analysis includes the evaluation of risks based on facility locations, some of which may be more vulnerable to the impacts of climate change.

Managing climate-related risks
Regulatory risks are managed at the regional level as regulations vary by jurisdiction. Regional environmental experts assess the risks and work with potentially impacted businesses to address them. One example of Air Products’ efforts to manage regulatory risks is our engagement with policy makers in Europe where we sought comparable treatment under the EU Emissions Trading System for all hydrogen producers, regardless of ownership structure, so as to not unduly disadvantage the over-the-fence supply model we use and which enables hydrogen to be produced most efficiently. In addition, the mitigation of costs through contractual terms, as well as our efforts to reduce the energy and emissions intensity of our operations, are part of our strategy to address transition risks.

Physical risks are addressed through plant design and engineering aimed at minimizing severe weather impacts. For example, our structures and related foundations are designed based on regional wind velocities that consider 50 years of climate data. Likewise, in the design and layout of our plants we evaluate how to eliminate or minimize flooding risks based on site drainage where we identify this as an issue, as well as the use of flood walls and elevation for sensitive equipment if necessary. Our Emergency Response and Business Continuity Planning processes also support the response to severe weather events that may be exacerbated by climate change.

Risks are also communicated across regions, shared with our Sustainability Leadership Council, and elevated to the Board of Directors, as appropriate.
Value chain stage(s) covered
Upstream

Risk management process
A specific climate-related risk management process

Frequency of assessment
Annually

Time horizon(s) covered
Short-term
Medium-term

Description of process
Energy is the primary raw material purchased to manufacture industrial gases, particularly electricity and steam for our air separation units and natural gas for our hydrogen plants. Because our industrial gas facilities use substantial amounts of energy, a disruption in the supply of energy, components, or raw materials, whether due to market conditions, legislative or regulatory actions, natural events, or other disruption, could prevent us from meeting our contractual commitments and harm our business and financial results.

Each year our Sustainability Team reviews the sustainability programs of suppliers that comprise 80% of our procurement spend to understand the suppliers’ approach to sustainable supply and actions being taken to address climate change. Of these suppliers, over 60% have sustainability programs and communicate their progress on sustainability. Ninety percent of our largest energy suppliers have demonstrated their commitment to sustainability through energy efficiency programs and transparency. We also look for opportunities to work with our suppliers on renewable energy.

Downstream

Risk management process
A specific climate-related risk management process

Frequency of assessment
More than once a year

Time horizon(s) covered
Short-term
Medium-term
Long-term

Description of process
The potential financial risks of legislative, regulatory and societal responses to global climate change are examined at least annually. As noted in our annual report, any
legislation that limits or taxes greenhouse gas emissions could reduce demand for certain products.

Air Products has a number of sustainable offerings that improve energy efficiency, reduce environmental impact, and/or address a societal need. Each year our Sustainability Team examines the sales of these offerings and looks for positive or negative trends. Our Sustainability Team, regional environmental experts and regional businesses also evaluate the potential for customers to deselect our products as increased customer concerns about climate risks could potentially lead to reduced product demand for certain products due to the energy intensity of company products.

We also examine how technology innovations could impact the use of our products. As the world’s largest supplier of hydrogen, Air Products supplies vast quantities of hydrogen to petroleum refiners to lower sulfur content and help in the making of cleaner-burning gasoline and diesel fuels that significantly reduce vehicle emissions. Technologies that improve fuel efficiency, reduce the weight of vehicles, or enable driverless vehicles could reduce consumption of transportation fuels that require hydrogen for processing. At the same time, we see significant opportunities to expand the use of hydrogen as a transportation fuel and energy carrier.

**C2.3**

(C2.3) Have you identified any inherent climate-related risks with the potential to have a substantive financial or strategic impact on your business?

Yes

**C2.3a**

(C2.3a) Provide details of risks identified with the potential to have a substantive financial or strategic impact on your business.
Identifier
Risk 1

Where in the value chain does the risk driver occur?
Direct operations

Risk type & Primary climate-related risk driver
Emerging regulation
Carbon pricing mechanisms

Primary potential financial impact
Increased direct costs

Company-specific description
Legislative, regulatory and societal responses to global climate change create financial risk.

We are the world’s leading supplier of hydrogen, the primary use of which is the production of ultra-low sulfur transportation fuels that have significantly reduced transportation emissions and helped improve human health. To make the high volumes of hydrogen needed by our customers, we use steam methane reforming, which releases carbon dioxide.

Some of our operations are within jurisdictions that have or are developing regulatory regimes governing emissions of greenhouse gases ("GHGs"), including carbon dioxide. These include existing coverage under the European Union Emission Trading System, the California cap and trade scheme, China’s Emission Trading Scheme and its nationwide expansion, and South Korea’s Emission Trading Scheme. In Canada, Alberta and Ontario are both in the development/approval process for new GHG regulations. Alberta’s Carbon Competitiveness Incentive Regulation ended December 31, 2019 and will be replaced by the proposed Technology Innovation and Emission Reduction ("TIER") System or Environment & Climate Change Canada’s Output Based Pricing System ("OBPS"). In lieu of adherence to the OBPS, Ontario seeks approval from Environment & Climate Change Canada to implement their proposed GHG Emissions Performance Standards program. In addition, the U.S. Environmental Protection Agency ("EPA") requires mandatory reporting of GHG emissions and is regulating GHG emissions for new construction and major modifications to existing facilities. Some jurisdictions have various mechanisms to target the power sector to achieve emission reductions, which often result in higher power costs.

Increased public concern may result in more international, U.S. federal, and/or regional requirements to reduce or mitigate the effects of GHG. Although uncertain, these developments could increase our costs related to consumption of electric power and hydrogen production. We believe we will be able to mitigate some of the increased costs through contractual terms, but the lack of definitive legislation or regulatory requirements
prevents an accurate estimate of the long-term impact these measures will have on our operations. Any legislation that limits or taxes GHG emissions could negatively impact our growth, increase our operating costs, or reduce demand for certain of our products.

**Explanation of financial impact figure**
The lack of definitive legislation or regulatory requirements prevents an accurate estimate of the impact these measures will have on our operations.

The estimate of $25 million assumes that:

- Our direct (Scope 1) CO2 emissions become subject to cap and trade schemes or carbon taxes
- The cost of carbon averages $30 per metric ton of CO2
- In excess of 95% of these costs are expected to be recovered through contractual terms

The calculation is as follows:

\[ 16,600,000 \text{ MT CO2} \times \$30/\text{MT CO2} \times 5\% = \$25,000,000 \]

**Cost of response to risk**
- 1,000,000

**Description of response and explanation of cost calculation**

Description of response:
Regional environmental experts identify and review risks (transitional and physical) related to climate change and communicate risks to potentially impacted businesses. The businesses work with environmental experts and Government Relations personnel.
to develop and execute strategies to address climate-related risks. One example of Air Products’ efforts to manage regulatory risks is our engagement with policy makers in Europe where we sought comparable treatment under the EU Emissions Trading System for all hydrogen producers, regardless of ownership structure, so as to not unduly disadvantage the over-the-fence supply model we use and which enables hydrogen to be produced most efficiently.

Explanation of cost calculation:
The company has incurred modest additional costs to actively engage in and monitor climate change risks and opportunities. This includes the efforts of our Environmental Teams, as well as costs associated with reduction commitments and customer engagement for cost recovery through contracts. Such costs are budgeted in the normal course of business. An estimate of the scale of those costs is less than $1 million per year.

<tr>
<td><strong>Company-specific description</strong></td>
<td>Energy, including electricity, natural gas, and diesel fuel for delivery trucks is the largest cost component of our business. Because our industrial gas facilities use substantial amounts of energy, energy price fluctuations could materially impact our revenues and earnings. A disruption in the supply of energy, components, or raw materials, whether due to market conditions, legislative or regulatory actions, natural events, or other disruption, could prevent us from meeting our contractual commitments and harm our business and financial results. We typically contract to pass-through cost increases in energy to customers, but cost variability can still have a negative impact on our results. We may be unable to raise prices as quickly as costs rise, or competitive pressures may prevent full recovery of such costs. Increases in energy or raw material costs that cannot be passed on to customers for competitive or other reasons may negatively impact our revenues and</td>

Likely

**Magnitude of impact**
Low

**Are you able to provide a potential financial impact figure?**
Yes, a single figure estimate

**Potential financial impact figure (currency)***
200,000,000

**Potential financial impact figure – minimum (currency)**

**Potential financial impact figure – maximum (currency)**

**Explanation of financial impact figure**
A hypothetical 10% increase in energy price increases due to GHG regulations would raise Air Products’ energy costs by $200 million based on our annual spend of $2 billion for energy. If the price of energy were to increase in this way, the company believes it would be able to mitigate a significant portion of the potential costs through contractual terms.

**Cost of response to risk**
1,000,000

**Description of response and explanation of cost calculation**
Description of response:
Energy consumption is the most significant variable cost of Air Products’ operations, and we carefully track and manage energy purchases. Our conservation programs are focused on continually improving energy efficiency across our plants, particularly our larger facilities that consume the most energy. For example, our steam methane reformers maximize energy efficiency and optimize heat integration. This reduces energy consumed and emissions by converting more feedstock into hydrogen. Likewise, we have continually improved the energy efficiency of our air separation units, and for our plants in North America, have improved energy efficiency by 30% since 1980.

Air Products has goals to improve energy efficiency for ASUs (air separation units) and HyCO (hydrogen, carbon monoxide, and syngas) facilities by 2.5% and 1.5%, respectively, by 2020 from a 2015 baseline. We continue to develop technologies that enable our customers and our facilities to lower energy consumption, improve efficiency
and reduce emissions. In 2019, half of our total R&D budget of $73 million was spent on products and processes that improved energy efficiency and/or benefitted the environment.

Explanation of cost calculation:
The company has incurred modest additional costs to actively engage in and monitor climate change risks and opportunities. This includes the efforts of our Environmental Teams, as well as costs associated with reduction commitments and customer engagement for cost recovery through contracts. Such costs are budgeted in the normal course of business. An estimate of the scale of those costs is less than $1 million per year.

**Where in the value chain does the risk driver occur?**
Direct operations

**Risk type & Primary climate-related risk driver**
Acute physical
Increased severity and frequency of extreme weather events such as cyclones and floods

**Primary potential financial impact**
Decreased revenues due to reduced production capacity

**Company-specific description**
Catastrophic events could disrupt our operations or the operations of our suppliers or customers, having a negative impact on our business, financial results, and cash flows. Our operations could be impacted by catastrophic events outside our control, including severe weather conditions such as hurricanes, floods and other storms. Any such event could cause a serious business disruption that could affect our ability to produce and distribute products and possibly expose us to third-party liability claims. Additionally, such events could impact our suppliers or customers, which could cause energy and raw materials to be unavailable to us, or our customers to be unable to purchase or accept our products and services. Any such occurrence could have a negative impact on our operations and financial results.

**Time horizon**
Short-term

**Likelihood**
Likely
Magnitude of impact
Low

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
10,000,000

Potential financial impact figure – minimum (currency)

Potential financial impact figure – maximum (currency)

Explanation of financial impact figure
Air Products has significant assets in areas that are subject to weather events that may be exacerbated by climate change, particularly in the U.S. Gulf Coast. The potential financial impact of $10 million is based on an analysis by Air Products and its insurers and considers the actual impacts of past weather events. The potential risk is spread over multiple locations and mitigated to a large extent by how the company designs its facilities, with environmental considerations such as wind, rainfall and flooding considered during plant siting and design.

Cost of response to risk
0

Description of response and explanation of cost calculation
Description of response:
Air Products ensures the resiliency of our facilities through engineering plant design. For example, our structures and related foundations are designed based on regional wind velocities that consider 50 years of climate data. Likewise, in the design and layout of our plants we evaluate how to eliminate or minimize flooding risks based on site drainage where we identify this as an issue, as well as the use of flood walls and elevation for sensitive equipment if necessary.

Explanation of cost calculation:
Engineering and equipment costs that support facility resiliency are included in the normal course of plant design, so there is no additional cost to respond to this risk.

**Where in the value chain does the opportunity occur?**

Downstream

**Opportunity type**

Products and services

**Primary climate-related opportunity driver**

Development and/or expansion of low emission goods and services

**Primary potential financial impact**

Increased revenues resulting from increased demand for products and services

**Company-specific description**

We have developed a portfolio of technologies that capture carbon dioxide (CO2) from steam methane reforming. In Port Arthur, Texas, Air Products operates the largest CO2 purification and capture project for enhanced oil recovery (EOR) by an industrial gas company. Air Products designed, constructed and operates the state-of-the-art system to capture CO2 from two steam methane reformers (SMRs) located at the Valero Port Arthur Refinery. The CO2 removal technology was retrofitted to the SMRs, which produce hydrogen to assist in the making of cleaner burning transportation fuels by refinery customers on Air Products’ Gulf Coast hydrogen pipeline network. Since 2013, when it initiated onstream capture operations, Air Products has captured nearly one million tons per year of CO2 at Port Arthur that has been put to beneficial use.

Carbon capture is essential to meeting the Paris climate goals. Significant opportunities are available to capture CO2 from gasifiers and hydrogen plants, and we can deploy our carbon capture technologies and other technologies developed by Air Products in new plants or by retrofitting existing ones.

**Time horizon**

Medium-term

**Likelihood**

Likely

**Magnitude of impact**

Medium

**Are you able to provide a potential financial impact figure?**
Yes, a single figure estimate

**Potential financial impact figure (currency)**

500,000,000

**Potential financial impact figure – minimum (currency)**

**Potential financial impact figure – maximum (currency)**

**Explanation of financial impact figure**

The potential financial impact of carbon capture depends on the policies and the partnership frameworks necessary for the advancement and proliferation of this technology. Internationally, momentum is building for carbon capture across the private sector, governments and industry bodies. Experts suggest that carbon capture deployment will need to increase by a factor of 25 by 2030 to meet the objectives of the Paris Agreement, which represents storing 850 metric tons per year, up from just 30 metric tons per year today.

In 2018 the global carbon capture and storage market was estimated to be worth nearly $5 billion. Assuming the market size remains about the same in the near term and Air Products captures at least 10% of the market with its carbon capture technologies, the potential financial impact would be at least $500 million. We see significant opportunities for carbon capture and expect the market size will increase accordingly.

**Cost to realize opportunity**

0

**Strategy to realize opportunity and explanation of cost calculation**

Strategy to realize opportunity:

We see significant opportunities to capture CO2 from gasifiers and hydrogen plants for use in enhanced oil recovery, sequestration and dry reforming. To pursue these opportunities, we have established a new, strategic organization focused on developing and winning large-scale CO2 capture and related technology projects around the world. We are also building on our experience and technology strengths related to carbon capture and are continuing to innovate new solutions. Likewise we continue to explore new possible end uses for captured carbon, supporting a more circular economy.

Explanation of cost to realize opportunity:

The cost to realize this opportunity are budgeted in the normal course of business therefore the cost to realize has been set at zero.

   Downstream

Opportunity type
   Energy source

Primary climate-related opportunity driver
   Use of lower-emission sources of energy

Primary potential financial impact
   Increased revenues resulting from increased demand for products and services

Company-specific description
   As the world’s largest hydrogen producer, we are an important contributor to bringing hydrogen to scale on the way to a clean energy future.

   The world faces a huge challenge in making the shift toward clean, sustainable energy sources. In many ways, hydrogen is a great solution. It enables the integration of renewables into power generation, fuels and distributing energy across sectors and regions supporting the decarbonization of transportation and energy use. When used in a fuel cell, hydrogen is nearly two times more efficient than gasoline and diesel on a well-to-wheel basis and produces no emissions. Hydrogen can also be made from renewable resources.

   To enable successful commercialization of hydrogen vehicles around the world, Air Products has taken a leadership position in the development of hydrogen supply and fueling infrastructure. Our plan has been to demonstrate how to build out a hydrogen market holistically. We are also supporting the development and use of hydrogen in trucks, buses, trains, river boats, cruise ships and for material handling.

Time horizon
   Short-term

Likelihood
   Virtually certain

Magnitude of impact
   Medium

Are you able to provide a potential financial impact figure?
   Yes, an estimated range

Potential financial impact figure (currency)

Potential financial impact figure – minimum (currency)
   5,000,000,000
Potential financial impact figure – maximum (currency)
7,500,000,000

Explanation of financial impact figure
Air Products expects the market for hydrogen will increase to $20-30 billion by 2030. Assuming Air Products captures 25% of this market share results in a potential financial impact of $5-7.5 billion.

Cost to realize opportunity
3,700,000,000

Strategy to realize opportunity and explanation of cost calculation
Strategy to realize opportunity:
Air Products sees significant opportunities to solve sustainability challenges through hydrogen for mobility. Air Products, the leading global supplier of hydrogen to refineries to assist in producing cleaner burning transportation fuels, has significant experience in the hydrogen fueling industry on which it can build. In fact, several sites today for certain hydrogen fueling applications are fueling at rates of over 75,000 refills per year. Use of the company’s fueling technology is increasing and is used in over 1.5 million hydrogen fills per year. The company has been involved in over 250 hydrogen fueling projects in the United States and 20 countries worldwide. Cars, trucks, vans, buses, scooters, forklifts, locomotives, planes, cell towers, material handling equipment, and even submarines have been fueled with Air Products’ technologies. We expect to see the global demand for hydrogen increase and are prepared to supply this valuable fuel. Our teams are also working on reducing the emissions created in the production of hydrogen, increasing the volume of lower-carbon hydrogen we produce, and investing in new, clean hydrogen solutions for our customers.

Explanation of cost to realize opportunity:
Air Products recently announced our agreement with ACWA Power and NEOM for a $5 billion world-scale green hydrogen-based ammonia production facility powered by renewable energy. The project, which will be equally owned by the three partners, will be sited in NEOM, a new model for sustainable living located in the northwest corner of the Kingdom of Saudi Arabia. The joint venture project is based on proven, world-class technology and will include the innovative integration of over four gigawatts of renewable power from solar, wind and storage; production of 650 tons per day of hydrogen by electrolysis technology; production of nitrogen by air separation using Air Products technology; and production of 1.2 million tons per year of green ammonia. Air Products will be the exclusive off-taker of the green ammonia and intends to transport it around the world to be dissociated to produce green hydrogen for the transportation market.

The $3.7 billion opportunity cost is based on Air Products’ share of the cost of the production facility plus our $2 billion investment in equipment to distribute the gas to end customers:

$5 billion x 33% + $2 billion = $3.7 billion

**Where in the value chain does the opportunity occur?**

Downstream

**Opportunity type**

Markets

**Primary climate-related opportunity driver**

Access to new markets

**Primary potential financial impact**

Increased revenues resulting from increased demand for products and services

**Company-specific description**

The potential demand for clean energy could increase demand for oxygen, one of our main products, and boost demand for our proprietary technology for delivering low-cost oxygen.

Air Products’ oxy-fuel systems enable the efficient production of biodiesel, biopower/bioheat, cellulosic biofuels and synthetic gas (syngas). Oxygen can increase boiler or furnace efficiency, reduce fuel consumption due to increased available heat, enable use of lower heating value fuels, increase flame stability, and increase turndown capability. Oxygen injection using Air Products’ oxy-fuel burners in boilers or furnaces can lead to lower oxygen consumption compared to general oxygen enrichment while providing the same benefits. Oxygen-enhanced gasification can convert abundant natural resources to syngas that enables the production of liquid fuels, high-end chemicals and power.

**Time horizon**

Short-term

**Likelihood**

Very likely

**Magnitude of impact**

Medium

Are you able to provide a potential financial impact figure?

Yes, an estimated range

**Potential financial impact figure (currency)**
Potential financial impact figure – minimum (currency)
183,000,000

Potential financial impact figure – maximum (currency)
365,000,000

Explanation of financial impact figure
In late 2018 Air Products Lu’an coal gasification project, located in Changzhi City, Shanxi Province, China, came onstream to supply syngas and other industrial gases to Lu’an Clean Energy’s syngas-to-liquids production. The world-scale gasification project includes four large air separation units (ASUs), four gasifiers and two syngas clean-up systems supporting one of China’s landmark clean energy demonstration projects. The ASU capacity is 10,000 tons per day of oxygen.

The potential financial impact is based on completing a project of similar scope and an oxygen price range of $50-100 per ton:

10,000 tons oxygen per day x 365 days x $ price per ton of oxygen = $183-$365 million

Similar projects are expected, though the potential financial impact figure is not available.

Cost to realize opportunity
300,000,000

Strategy to realize opportunity and explanation of cost calculation
Strategy to realize opportunity:
We see significant opportunities to solve sustainability challenges through gasification, carbon capture technology solutions, and hydrogen for mobility and the energy transition. Gasification enables an environmentally friendly way to use plentiful, lower value feedstocks, and technology strength is key in this area.

Our combustion technologists, industry engineers, and modelling specialists have decades of experience in oxygen-based technologies and work with customers to develop and test at full scale actual combustion and gasification systems using a full spectrum of gaseous, liquid, and solid fuels. Our Advanced Clean Energy Laboratory enables live, remote participation in testing via online video and data sharing.

We have acquired leading technologies for gasification – Shell’s Coal Gasification Process (SCGP) and GE Energy’s gasification technology – that give us the ability to process low value feedstocks more efficiently and to reduce overall emissions. With these technologies and our other capabilities we can provide a complete solution to our customers, including development, technology, engineering, construction, and operation of large syngas projects.

Explanation of cost to realize opportunity:
Air Products invested $300 million to build, own and operate the four large ASUs supplying the Changzhi City site.

</thead>
</table>

How our strategy has been influenced by climate-related risks and opportunities and the time horizon(s) it covers:

Industrial gas manufacturing is energy intensive. To reduce our exposure to potential risks related to the energy we purchase we have reduced the emissions intensity of our products, increased our sources of renewable energy and instituted contractual clauses to address energy cost increases due to climate regulations. These actions have been taken over the past several years and will continue.

Most substantial strategic decision(s) that have been influenced by the climate-related risks and opportunities:

Over the past several years we have increased our purchases of renewable electricity, particularly in France and the United Kingdom, and implemented several projects to produce renewable electricity.

Discussion

Energy is the primary raw material purchased to manufacture industrial gases, particularly electricity and steam for our air separation units and natural gas for our hydrogen plants. Because our industrial gas facilities use substantial amounts of energy, a disruption in the supply of energy, components, or raw materials, whether due to market conditions, legislative or regulatory actions, natural events, or other disruption, could prevent us from meeting our contractual commitments and harm our business and financial results.

We look for opportunities to work with our suppliers on
Air Products increased its use of renewable energy in 2019, continuing our journey to identify green energy sources that can reduce our energy costs and environmental footprint. In some countries we purchase renewable electricity, including the United Kingdom, while in France we purchase guarantees of origin. We have worked with suppliers to install solar arrays at several of our production and office facilities, generating electricity for internal consumption.

| Investment in R&D | Yes |

**How our strategy has been influenced by climate-related risks and opportunities and the time horizon(s) it covers:**

The world faces a huge challenge in making the shift towards clean, sustainable energy sources. This shift presents opportunities for Air Products to build on its product and technology portfolio and develop new offerings today, tomorrow and for the future.

Most substantial strategic decision(s) that have been influenced by the climate-related risks and opportunities:

In 2019 Air Products substantially expanded its R&D efforts in three areas – gasification, carbon capture and hydrogen for mobility and energy storage.

**Discussion**

Our research groups are aligned with our businesses and focus on improving our processes and helping our customers. In 2019, more than half of our R&D budget of $73 million supported products and processes that improved energy efficiency and/or benefitted the environment.

In 2019, Air Products increased its focus on three key innovation areas that are also opportunities to enhance the sustainability of our customers:

**Gasification**

Countries and large companies around the world continue to focus on gasification to use abundant natural resources to make synthetic gas. Gasification also provides a solution for refineries that need to find a use for high sulfur bottom-of-the-barrel liquids that can no longer be used as fuel for ships, and for petroleum coke.

**Carbon Capture**
Carbon capture is a high-impact opportunity to help tackle climate change and will be essential to meet the Paris climate goals. We see significant opportunities to capture CO2 from gasifiers and hydrogen plants for use in sequestration, enhanced oil recovery and productive use of CO2. Likewise, we continue to explore new possible end uses for captured carbon, supporting a more circular economy.

Hydrogen and the Energy Transition
As the world’s largest hydrogen producer, we are an important contributor to bringing hydrogen to scale on the way to a clean energy future. We are increasing our production of lower-carbon hydrogen and investing in new, clean hydrogen solutions for our customers.

<table>
<thead>
<tr>
<th>Operations</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>How our strategy has been influenced by climate-related risks and opportunities and the time horizon(s) it covers:</td>
<td></td>
</tr>
</tbody>
</table>

Industrial gas manufacturing is energy intensive. To reduce our exposure to potential risks related to the energy we purchase we have reduced the emissions intensity of our products through efficiency improvements and energy/emissions reduction goals.

Most substantial strategic decision(s) that have been influenced by the climate-related risks and opportunities:

In 2016 we established 2020 Sustainability goals that included saving energy, reducing GHG emissions in operations and improving fleet efficiency. We have invested in facility improvements, modified operations and upgraded our fleet in support of these goals.

Discussion
Industrial gas manufacturing is energy intensive. We carefully track and manage energy purchases, and our conservation programs are focused on continually improving energy efficiency across our plants, particularly larger facilities. Our 2020 environmental sustainability goals are aimed at reducing our impact on the environment. The goals use 2015 as the baseline year and include:
- saving energy by reducing use intensity by 2.5% for air gases and 1.5% for hydrogen;
- reducing GHG emissions intensity by 2%;
- improving efficiency and reducing CO2 emissions related
to distribution by 10%; and
- conserving water and lowering use intensity by 5%.

In 2019 we exceeded our GHG emissions intensity goal and our energy intensity goal for air gases (we had already exceeded our distribution and water goals). Efficiency improvements were realized through higher plant utilization, increased production at new, larger and more efficient facilities and hundreds of facility improvement projects (see question C4.3a-b and C7.9a).

We have made several investments over the past several years to improve fleet efficiency, reduce fuel consumption and lower CO2 emissions. This included replacing 30% of our North American tractors, 65% of our fleet in the UK with fuel efficient Euro 6 compliant tractors and replacing additional tractors in Belgium, France and the Netherlands. Upgrades also included higher payloads on some vehicles that increased tons of product shipped per distance driven and fuel efficiency.

**C3.1e**

(C3.1e) Describe where and how climate-related risks and opportunities have influenced your financial planning.

<table>
<thead>
<tr>
<th>Financial planning elements that have been influenced</th>
<th>Description of influence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revenues</td>
<td>Our business strategy focuses on creating value in the markets we serve, particularly energy, environmental and emerging markets. Our business planning process is completed annually for each fiscal year. The process considers growth opportunities, including those related to climate change, as well as climate risk management through energy efficiency and GHG emissions reduction efforts. Below are some examples of these considerations.</td>
</tr>
<tr>
<td>Direct costs</td>

</tr>
<tr>
<td>Indirect costs</td>
<td></td>
</tr>
<tr>
<td>Capital expenditures</td>
<td></td>
</tr>
<tr>
<td>Acquisitions and divestments</td>
<td></td>
</tr>
<tr>
<td>Access to capital</td>
<td></td>
</tr>
<tr>
<td>Revenues</td>
<td>Air Products’ sustainable offerings are products that improve energy efficiency, reduce environmental impact, and/or address a societal need. Each year we examine our revenues related to our sustainable offerings, which represented 53% of our revenues in 2019. As we look forward, we see significant opportunities for gasification, carbon capture technologies and hydrogen for mobility and the transition to a low carbon economy. Potential revenues for these businesses have been considered in our financial planning, however the details are confidential.</td>
</tr>
</tbody>
</table>
### Direct Costs
GHG emissions from industrial gas manufacturing are driven by energy consumption. Air separation units require electricity or steam to compress air so it can be cryogenically distilled into oxygen, nitrogen and argon. Likewise, the production of hydrogen consumes hydrocarbons as a feedstock and/or fuel in the production process. Energy consumption is the most significant variable cost of Air Products’ operations, and we carefully track and manage energy purchases. Our conservation programs are focused on continually improving energy efficiency across our plants to reduce energy consumption and GHG emissions. Each year as part of our business planning cycle the efficiencies of our operations are examined and business objectives are set to improve energy efficiency. Likewise, the company has goals to improve energy efficiency for ASUs (air separation units) and HyCO (hydrogen, carbon monoxide, and syngas) facilities by 2.5% and 1.5%, respectively, by 2020 from a 2015 baseline.

### Capital Expenditures
Air Products develops and deploys technology for the world to meet its energy and productivity needs. Our core competency is our ability to develop, execute, own and operate complex process facilities that transform the resources available to our customers into engines of economic growth and social development. Many of these facilities require significant capital investment, which is included in our financial planning. A recent example is our agreement with ACWA Power and NEOM for a $5 billion world-scale green hydrogen-based ammonia production facility powered by renewable energy.

115

Target status in reporting year

Achieved

Is this a science-based target?

No, and we do not anticipate setting one in the next 2 years

Please explain (including target coverage)

Our intensity goal is configured as the ratio of reporting year (2019) emissions to reporting year production divided by the emission to production ratio in our base year (2015). Using a ratio allows the reported results to be dimensionless and protects confidential production data. For 2019, our GHG intensity was reduced by 2.3% from the baseline year and we exceeded our goal. This progress was due to our improvements in energy efficiency. In 2019, our air separation units realized a 3.7% improvement in energy intensity from a baseline year of 2015. Our hydrogen and carbon monoxide units improved energy efficiency by 0.9%. These successes were realized through the commissioning of new, larger and more efficient facilities, as well as hundreds of facility improvement projects involving changes to equipment and manufacturing processes.

Air Products has developed a new carbon intensity reduction goal that it will announce in 2020.

Achieved

Is this a science-based target?
No, and we do not anticipate setting one in the next 2 years

Please explain (including target coverage)
Our fleet intensity goal is configured as the ratio of reporting year (2019) emissions to reporting year product delivered divided by the emission to delivery ratio in our base year (2015). Using a ratio allows the intensity value to be dimensionless and protects confidential production and distribution data. For 2019, our GHG intensity related to deliveries was reduced by 18% from the baseline year, and we have exceeded our goal.

We have made numerous investments over the past several years to improve fleet efficiency, reducing fuel consumption and CO2 emissions. This included replacing 30% of our North American tractors, 65% of our fleet in the UK with fuel efficient Euro 6 compliant tractors and replacing additional tractors in Belgium, France and the Netherlands. Upgrades also included higher payloads on some vehicles that increased tons of product shipped per distance driven and fuel efficiency. We have exceeded our distribution efficiency goal.

Target status in reporting year
Achieved

Is this target part of an emissions target?
The target is related to our 2020 target to reduce GHG emissions intensity by 2%.

Industrial gas manufacturing is energy intensive and our direct (Scope 1) and indirect (Scope 2) CO2 emissions are related to the energy we consume. Improving energy efficiency also reduces our CO2 emissions intensity.

This goal applies to our air separation units that require electricity or steam to compress air so it can be cryogenically distilled into oxygen, nitrogen and argon. Our 2020 goal, from a 2015 baseline, is to save energy by reducing energy use intensity by 2% for air gas production. We exceeded this goal in 2019, achieving a 2.3% reduction.

Is this target part of an overarching initiative?
No, it's not part of an overarching initiative

Please explain (including target coverage)
This goal covers our industrial gases businesses that are related to air gases (nitrogen, oxygen and argon).

Our intensity goal is configured as the ratio of reporting year (2019) emissions to reporting year production divided by the emission to production ratio in our base year (2015). Using a ratio allows the reported results to be dimensionless and protects confidential production data. In 2019, our air separation units realized a 3.7% improvement in energy intensity from a baseline year of 2015 and Air Products exceeded this goal. These successes were realized through the commissioning of new, larger and more efficient facilities, as well as hundreds of facility improvement projects involving changes to equipment and manufacturing processes.

Is this target part of an emissions target?
The target is related to our 2020 target to reduce GHG emissions intensity by 2%.

Industrial gas manufacturing is energy intensive and our direct (Scope 1) and indirect (Scope 2) CO2 emissions are related to the energy we consume. Improving energy efficiency also reduces our CO2 emissions intensity.

This goal applies to the production of hydrogen, which consumes hydrocarbons as a feedstock and/or fuel in the production process. Our 2020 goal, from a 2015 baseline, is to save energy by reducing energy use intensity by 1.5% for hydrogen production.

Is this target part of an overarching initiative?
No, it's not part of an overarching initiative

Please explain (including target coverage)
This goal covers our hydrogen businesses.

Our intensity goal is configured as the ratio of reporting year (2019) emissions to reporting year production divided by the emission to production ratio in our base year (2015). Using a ratio allows the reported results to be dimensionless and protects confidential production data. In 2019, our hydrogen business improved energy efficiency by 0.9% from a baseline year of 2015. These successes were realized through the commissioning of new, larger and more efficient facilities, as well as hundreds of facility improvement projects involving changes to equipment and manufacturing processes.

Is this target part of an emissions target?
The target is related to our 2020 targets to improve energy efficiency in our air separation units and hydrogen production.

We use water primarily for cooling, to make hydrogen using the steam methane reforming (SMR) process and to provide steam and water to our customers. Because of
these uses, our water consumption is tied closely to energy use; therefore, improvements in energy efficiency can also conserve water. We also recognize the link between climate change and water, and are tracking water consumption at our facilities, paying particular attention to those in water stressed areas.

Our 2020 goal, from a 2015 baseline, is to save energy water by reducing water use intensity by 5%. We achieved this goal several years ago and continue to improve our water stewardship, achieving a 26% decrease in water intensity in 2019 (from the 2015 baseline).

**Is this target part of an overarching initiative?**

No, it's not part of an overarching initiative

**Please explain (including target coverage)**

Each year, Air Products inventories water withdrawals, discharges and consumption for approximately 200 facilities that cover an estimated 95% of the company’s total water consumption. Over 90% of the data for the inventory is based on invoices and/or water meters. The remaining values are engineering estimates.

Our intensity goal is configured as the ratio of reporting year (2019) water consumption to reporting year production divided by the water consumption to production ratio in our base year (2015). Using a ratio allows the reported results to be dimensionless and protects confidential production data.

### C4.3

<td>Employee engagement</td>
<td>Air Products has a robust productivity improvement process. Employee recommendations to improve productivity frequently focus on energy conservation and emissions reduction projects. These ideas are tracked in a global, central database that includes quantified costs and benefits. Data from this system was used to respond to previous questions (C4.3a and C4.3b).</td>
</tr>
</tbody>
</table>
Employees are recognized for progress against achieving our climate change objectives, developing new commercial offerings that yield cost-effective solutions to our customers’ GHG emission reduction needs and bringing such solutions to the marketplace, and implementing effective work processes to compile the GHG inventory and satisfy regulatory compliance and reporting requirements. Efforts are recognized through existing compensation and awards programs, such as our Chairman's Environmental, Health, Safety and Sustainability Awards.

Air Products seeks opportunities to collaborate with governments on technology developments. For example, the company has employed novel CO2 capture technology for one of the largest carbon capture and storage demonstration projects in the world by working with the U.S. Department of Energy.

(C4.5) Do you classify any of your existing goods and/or services as low-carbon products or do they enable a third party to avoid GHG emissions?

Yes

(C4.5a) Provide details of your products and/or services that you classify as low-carbon products or that enable a third party to avoid GHG emissions.

<table>
<thead>
<tr>
<th>Level of aggregation</th>

</thead>
<tbody>
<tr>
<td>Group of products</td>
<td>Air Products’ gases and applications enable its customers and downstream users to reduce and/or avoid emissions of CO2. These products include but are not limited to:</td>
</tr>
</tbody>
</table>

Oxy-fuel Technology - Air Products’ oxy-fuel combustion technologies are used in energy-intensive applications like cement, metals and glass manufacturing to increase production, lower fuel use and costs, reduce emissions and optimize efficiency. We continue to help customers improve operations and efficiency through new burner designs and performance testing at our world-class combustion laboratory facilities.

Hydrogen - Hydrogen is used to refine heavier, sour crudes, increase refinery yields and reduce emissions through cleaner transportation fuels including ultralow sulfur diesel fuel and hydrogen powered electric fuel cell vehicles. Air Products is the world’s largest provider of hydrogen, operating over 100 hydrogen plants and providing hydrogen from pipeline systems around the globe.
LNG Process Technology and Equipment - Air Products' liquefied natural gas (LNG) technology and equipment enable the efficient and economic production and transport of this critical energy resource, including from remote/stranded energy sources around the globe. More LNG is produced using Air Products' mixed component refrigerant and liquefaction processes than any other processes, with over 100 LNG trains currently in operation.

SmartFuel® Technology - Hydrogen can be used in many different types of transportation, either in a fuel cell or an internal combustion engine, to eliminate or significantly reduce emissions. Our SmartFuel® hydrogen fueling station technology provides complete fueling infrastructure from supply to dispensing for fuel cell vehicles and is used in 1.5 million hydrogen fills per year.

We estimate that our products and applications enabled the avoidance of 69 million MT CO2e in 2019.

**Are these low-carbon product(s) or do they enable avoided emissions?**

Avoided emissions

**Taxonomy, project or methodology used to classify product(s) as low-carbon or to calculate avoided emissions**

Addressing the Avoided Emissions Challenge - Chemicals sector

% revenue from low carbon product(s) in the reporting year

0

**Comment**

Air Products has several sustainable offerings that improve energy efficiency, reduce environmental impact, and/or address a societal need. Each year we assess the sales of these offerings to estimate the percentage of our revenue related to these offerings and look for positive or negative trends. In 2019, 53% of our revenue was related to these sustainable offerings. Also, in 2019 these offerings enabled our customers and downstream users to avoid the equivalent of 69 million metric tons of carbon dioxide emissions. This figure is 2.5 times our own direct and indirect CO2e emissions. Revenues for low carbon products are not tracked separately.

C6. Emissions data

C6.1

(C6.1) What were your organization’s gross global Scope 1 emissions in metric tons CO2e?

Reporting year

| Gross global Scope 1 emissions (metric tons CO2e) | 16,600,000 |
| Start date | January 1, 2019 |
| End date | December 31, 2019 |

Comment

Air Products' direct (Scope 1) and indirect (Scope 2) CO2 emissions are related to the energy we consume. In 2019, our Scope 1 GHG emissions, which are primarily from hydrogen production and steam exported to customers, totaled 16.6 million MT, representing a 1% increase from the prior year. On an intensity basis, our combined Scope 1 and Scope 2 emissions improved by 2.3% due to energy efficiency improvements and we met our GHG emissions intensity goal for 2020. We measure our performance against a baseline year of 2015, which was chosen because it was the expiration date of Air Products' first set of sustainability goals.

Scope 1 GHG emissions include the following applicable gases: CO2, methane (CH4) and nitrous oxide (N2O). CO2e represents the combined carbon emissions of these gases. We use the World Resources Institute (WRI) / World Business Council for Sustainable Development (WBCSD) Greenhouse Gas Protocol standard to define organizational and operational boundaries, emission calculation methodologies, and inventory quality aspects to ensure an accurate and representative inventory. Where required we follow regulatory guidelines for emissions reporting.

We apply the financial control method and use publicly available global warming potentials and emissions factors, primarily from the Intergovernmental Panel on Climate Change, International Energy Agency, and U.S. Energy Information Administration.

Past year 1

| Gross global Scope 1 emissions (metric tons CO2e) | 16,500,000 |
| Start date | January 1, 2018 |

C6.2

(C6.2) Describe your organization’s approach to reporting Scope 2 emissions.

Row 1

Scope 2, location-based
We are reporting a Scope 2, location-based figure

Scope 2, market-based
We have operations where we are able to access electricity supplier emission factors or residual emissions factors, but are unable to report a Scope 2, market-based figure

Comment
Air Products has chosen not to report a market-based figure because it is challenging to get reliable and accurate emissions factors. Locations for which we can obtain reliable and accurate emissions factors are outside the financial control boundary used for our GHG inventory and therefore are not reported as part of our Scope 2 emissions.

As reported in our 2020 Sustainability Report, the majority of the renewable electricity we purchase is used in France and the United Kingdom.

Comment
Scope 2 GHG emissions include the following applicable gases: CO2, CH4 and N2O. CO2e represents the combined carbon emissions of these gases. We use the World Resources Institute (WRI) / World Business Council for Sustainable Development (WBCSD) Greenhouse Gas Protocol standard to define organizational and operational boundaries, emission calculation methodologies, and inventory quality aspects to ensure an accurate and representative inventory. Where required we follow regulatory guidelines for emissions reporting.

We apply the financial control method and use publicly available global warming potentials and emissions factors, primarily from the Intergovernmental Panel on Climate Change, International Energy Agency, and U.S. Energy Information Administration.

Scope 1 emissions for 2016 have been restated due to acquisitions, divestitures and improved methodologies.

C6.4

(C6.4) Are there any sources (e.g. facilities, specific GHGs, activities, geographies, etc.) of Scope 1 and Scope 2 emissions that are within your selected reporting boundary which are not included in your disclosure?
No

C6.5

(C6.5) Account for your organization’s gross global Scope 3 emissions, disclosing and explaining any exclusions.

Purchased goods and services

Evaluation status
Not relevant, explanation provided

Please explain
The principal raw materials for making atmospheric gases and hydrogen are air, electricity, steam and natural gas. Scope 3 emissions related to the electricity, steam and natural gas used as a fuel are covered below under “fuel-and-energy-related activities (not included in Scope 1 or 2).”

Air Products has applied a 2% materiality threshold to its Scope 3 emissions for 2019. This threshold is 130,000 metric tons of CO2e. Emissions related to other goods and services purchased were estimated in prior years (2016 and earlier) and did not meet the 2% materiality threshold. As a result, the emissions are considered not relevant.
**Capital goods**

**Evaluation status**
Not relevant, explanation provided

**Please explain**
Air Products has applied a 2% materiality threshold to its Scope 3 emissions for 2019. This threshold is 130,000 metric tons of CO2e. Emissions related to capital goods purchased have been estimated in prior years (2016 and earlier) and did not meet the 2% materiality threshold. As a result, the emissions are considered not relevant.

**Fuel-and-energy-related activities (not included in Scope 1 or 2)**

**Evaluation status**
Relevant, calculated

**Metric tonnes CO2e**
3,500,000

**Emissions calculation methodology**
Fuel consumption values were determined for each facility and summed by country or region as the embedded carbon in fuels can vary by country or region. Cradle-to-gate emissions factors related to the production of each fuel type were obtained from life-cycle assessment databases for each country or region. For each fuel type, the amount of fuel consumed was multiplied by the fuel’s cradle-to-gate emissions factor specific to the respective country or region to calculate the individual emissions. These emissions were subsequently summed to determine the total emissions. For electricity consumption, the fuel types and the amount of each were determined based on regional grid mixes, heat rates for respective fuel-type power plants and heating value of fuel types. Fuel related to electricity was adjusted to account for the transmission and distribution losses for the regions as per data from World Development Indicators.

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
100

**Please explain**
Fuel usage was determined primarily from supplier invoices or invoice-quality data. The fuel and energy related emissions were subject to limited assurance by WSP (see 2019 Greenhouse Gas Inventory Verification at http://www.airproducts.com/~/media/Files/PDF/company/2019-greenhouse-gas-inventory-verification.pdf).

**Upstream transportation and distribution**

**Evaluation status**
Not relevant, explanation provided

**Please explain**
The principal raw materials for making atmospheric gases and hydrogen are air, electricity, steam and natural gas. Steam and natural gas are supplied via pipelines and do not require upstream transportation.

Air Products has applied a 2% materiality threshold to its Scope 3 emissions for 2019. This threshold is 130,000 metric tons of CO2e. Emissions related to upstream transportation and distribution for other products have been estimated in prior years (2016 and earlier) and did not meet the 2% materiality threshold. As a result, the emissions are considered not relevant.

Waste generated in operations

<table>

Air Products has applied a 2% materiality threshold to its Scope 3 emissions for 2019. This threshold is 130,000 metric tons of CO2e. Emissions related to employee commuting have been estimated in prior years (2016 and earlier) and did not meet the 2% materiality threshold. As a result, the emissions are considered not relevant.

Upstream leased assets

<table>
<thead>
<tr>
<th>Evaluation status</th>
<th>Not relevant, explanation provided</th>
</tr>
</thead>
</table>

Please explain
Air Products has applied a 2% materiality threshold to its Scope 3 emissions for 2019. This threshold is 130,000 metric tons of CO2e. Emissions related to upstream leased assets have been estimated in prior years (2015 and earlier) and did not meet the 2% materiality threshold. As a result, the emissions are considered not relevant.

**Downstream transportation and distribution**

**Evaluation status**
Not relevant, explanation provided

**Please explain**
Emissions related to the distribution of company products using Air Products’ fleet are included in our Scope 1 emissions.

Air Products has applied a 2% materiality threshold to its Scope 3 emissions for 2019. This threshold is 130,000 metric tons of CO2e. Emissions related to downstream transportation and distribution using vehicles not owned or controlled by Air Products have been estimated in prior years (2018 and earlier) and did not meet the 2% materiality threshold. As a result, the emissions are considered not relevant.

**Processing of sold products**

**Evaluation status**
Not relevant, explanation provided

**Please explain**
Air Products manufactures a variety of gases that are used in over 30 industries. Most company products are gases that are consumed in our customers’ processes. Emissions from the processing of these products cannot be reliably estimated.

**Use of sold products**

**Evaluation status**
Relevant, calculated

**Metric tonnes CO2e**
1,900,000

**Emissions calculation methodology**
Most gaseous products are fully consumed or incorporated into other products. Exceptions include certain uses of carbon dioxide, including food and beverage applications, and nitrous oxide used for medical purposes. Emissions related to these products and applications were estimated based on sales volumes and assuming that the gases would ultimately be emitted to the atmosphere. For example, nitrous oxide used in medical applications was assumed to be fully exhaled by patients and enter the atmosphere. The total amount of nitrous oxide sold for medical applications was subsequently multiplied by the global warming potential for nitrous oxide to determine emissions in CO2e. These emissions were added to the emissions from the CO2 business to estimate the total Scope 3 emissions for this category.
Percentage of emissions calculated using data obtained from suppliers or value chain partners
0

Please explain
Emissions have been estimated based on sales volumes of carbon dioxide and nitrous oxide. Sales volumes are tracked internally via SAP.

End of life treatment of sold products

Evaluation status
Not relevant, explanation provided

Please explain
Most gaseous products are fully consumed or incorporated into other products and do not require end of life treatment.

Downstream leased assets

Evaluation status
Not relevant, explanation provided

Please explain
Air Products does not have downstream leased assets.

Franchises

Evaluation status
Not relevant, explanation provided

Please explain
Air Products does not have franchises.

Investments

Evaluation status
Relevant, calculated

Metric tonnes CO2e
1,200,000

Emissions calculation methodology
Most of our investments are non-publicly traded ventures with other companies in the industrial gases business. Emissions related to joint ventures that are consolidated in our financial statements are included in our Scope 1 and 2 emissions reported herein.

Investment emissions are estimated for equity affiliates and investments not under Air Products’ control. Emissions per unit revenue are calculated for Air Products’ businesses as part of our annual GHG inventory process. These factors are applied to the incomes from the equity affiliates and investments by business type to estimate
emissions based on revenue. These emissions are subsequently summed to estimate the total emissions for equity affiliates and investments.

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**

100

**Please explain**

Emissions are estimated based on the incomes reported by our equity affiliates and investments, so 100 percent of the calculated emissions are based on data from value chain partners.

**Other (upstream)**

**Evaluation status**

Not relevant, explanation provided

**Please explain**

No additional upstream Scope 3 emissions.

**Other (downstream)**

**Evaluation status**

Not relevant, explanation provided

**Please explain**

No additional downstream Scope 3 emissions.

**C6.7**

**(C6.7) Are carbon dioxide emissions from biogenic carbon relevant to your organization?**

No

**C6.10**

**(C6.10) Describe your gross global combined Scope 1 and 2 emissions for the reporting year in metric tons CO2e per unit currency total revenue and provide any additional intensity metrics that are appropriate to your business operations.**

**Intensity figure**

0.003

**Metric numerator (Gross global combined Scope 1 and 2 emissions, metric tons CO2e)**

27,200,000

**Metric denominator**
unit total revenue

**Metric denominator: Unit total**  
8,919,000,000

**Scope 2 figure used**  
Location-based

**% change from previous year**  
2

**Direction of change**  
Increased

**Reason for change**  
Emissions were up in 2019 relative to 2018 due to production increases needed to meet customer demands. We do not have a homogeneous customer base or end market. As a result, revenues can vary and may not track with production and emissions.

Our direct (Scope 1) and indirect (Scope 2) CO2 emissions are related to the energy we consume. In 2019, our Scope 1 GHG emissions, which are primarily from our hydrogen operations were 16.6 million MT, representing a 1% increase from the prior year. Our Scope 2 emissions, which are due in large part to the electricity and steam we consume in our air separation units, were 10.6 million MT in 2019, which was a 3% increase from 2018. On an intensity basis, our combined Scope 1 and Scope 2 emissions improved by 2.3% due to energy efficiency improvements and we met our GHG emissions intensity goal for 2020.

---

</table>
Air Products increased its use of renewable energy in 2019, continuing our journey to identify green energy sources that can reduce our energy costs and environmental footprint. In some countries we purchase renewable electricity, including the United Kingdom, while in France we purchase guarantees of origin. We have installed solar arrays at several of our production and office facilities, generating electricity for internal consumption. Overall, 23% of our electricity purchases were from renewable sources in 2019.

The reduction in emissions due to the increased use of renewable electricity was estimated in two steps. First the increase in renewable electricity purchases was calculated as the difference between renewable electricity purchases in 2018 and 2019. This difference was then multiplied by an average emissions factor (kg CO2e/MWh) for the electricity used across our facilities. This resulted in an emissions reduction of 178,000 metric tons CO2e.

The emissions value percentage was calculated as the difference in emissions between 2018 and 2019 due to renewable electricity purchases divided by Air Products' total emissions in 2018, or:

\[
\frac{178,000 \text{ MT}}{26,800,000 \text{ MT}} = 0.66\%
\]

<table>
<thead>
<tr>
<th>Change in renewable energy consumption</th>

</tr>
</tbody>
</table>
energy efficiency in production processes, process material efficiency efforts that reduced process emissions, improvements in transportation efficiency through procurement of more efficient tractor trailers and optimization of shipping routes, solar PV installations to generate low-carbon energy and replacement of lights to improve energy efficiency. Overall these projects saved an estimated 150,300 metric tons of CO2e.

The emissions value percentage was calculated as the emissions saved divided by Air Products’ total emissions in 2018, or:

\[
\frac{150,300 \text{ MT}}{26,800,000 \text{ MT}} = 0.56\%
\]

These projects contribute substantially to Air Products' 2020 goals (from 2015 baseline) to improve energy use intensity by 2% for air gas production and by 1.5% for hydrogen production, and to reduce emissions intensity by 2%.

Description
Other, please specify
Water Intensity
Metric value
0.74

Metric numerator
Water Intensity in current year

Metric denominator (intensity metric only)
Water Intensity in baseline year

% change from previous year
30

Direction of change
Decreased

Please explain
We use water primarily for cooling, to make hydrogen using the steam methane reforming (SMR) process and to provide steam and water to our customers. Because of these uses, our water consumption is tied closely to energy use; therefore, improvements in energy efficiency can also conserve water. We also recognize the link between climate change and water, and are tracking water consumption at our facilities, paying particular attention to those in water stressed areas.

Our 2020 goal, from a 2015 baseline, is to save energy water by reducing water use intensity by 5%. We achieved this goal several years ago and continue to improve our water stewardship, achieving a 26% decrease in water intensity in 2019 (from the 2015 baseline).

C-CH9.3a

</table>
herein are both large scale commercial deployment.

Our research groups are aligned with our businesses and focus on improving our processes and helping our customers. Research and Development (R&D) concentrates on new and improved processes and equipment for the production and delivery of industrial gases and new or improved applications for industrial gas products that help our customers improve sustainability. In 2019, more than half of our R&D budget of $73 million supported products and processes that improved energy efficiency and/or benefitted the environment. This was also true for 2018 and 2017 when half of our R&D budgets of $65 million and $58 million, respectively we related to energy efficiency or environmental benefits.

In 2019, Air Products increased its focus on key innovation areas that are also opportunities to enhance the sustainability of our customers, including:

Carbon Capture
Carbon capture is a high-impact opportunity to help tackle climate change and will be essential to meet the Paris climate goals. We see significant opportunities to capture CO2 from gasifiers and hydrogen plants for use in sequestration, enhanced oil recovery and productive use of CO2. We can deploy these carbon capture technologies in new plants or in retrofits of existing facilities.
The stage of development for this technology is large scale commercial deployment.

Hydrogen and the Energy Transition
As the world’s largest hydrogen producer, we are a significant contributor to bringing hydrogen to scale on the way to a clean energy future. Our team is working on reducing the emissions created in the production of hydrogen. We are also increasing the volume of lower-carbon hydrogen we produce and are investing in new, clean hydrogen solutions for our customers, as exemplified by our agreement with ACWA Power and NEOM for a $5 billion world-scale green hydrogen-based ammonia production facility powered by renewable energy. The stage of development for this technology is large scale commercial deployment.

C10. Verification

C11.1d

(C11.1d) What is your strategy for complying with the systems you are regulated by or anticipate being regulated by?

Our current strategy regarding allowance trading under the various emission trading schemes is to properly manage the compliance obligations of each of our facilities. Air Products pursues operating efficiency improvements wherever possible to minimize our compliance obligation. Where necessary, Air Products will purchase allowances/compliance instruments to satisfy its compliance obligations. If allowances allocated to the company exceed the current compliance obligations, allowances will be retained for future compliance needs. Air Products is not trading allowances speculatively.

An example of the execution of this strategy is our approach to the EU Emissions Trading System (ETS). Air Products has three facilities in the EU that are subject to the EU ETS. The total emissions of these facilities exceeded the allowances allocated. As a result, Air Products worked with its customers to ensure the appropriate allowances were purchased to cover our obligations. Air Products mitigates some of the costs of purchasing allowances through contractual terms.

C11.2

(C11.2) Has your organization originated or purchased any project-based carbon credits within the reporting period?
No

C11.3

(C11.3) Does your organization use an internal price on carbon?
No, and we do not currently anticipate doing so in the next two years

C12. Engagement

C12.1

(C12.1) Do you engage with your value chain on climate-related issues?
   Yes, our suppliers
   Yes, our customers
   Yes, other partners in the value chain

C12.1a

(C12.1a) Provide details of your climate-related supplier engagement strategy.

<table>

<table>
<thead>
<tr>
<th>Rationale for the coverage of your engagement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Each year our Sustainability Team reviews the sustainability programs of suppliers that comprise 80% of our procurement spend to understand the suppliers’ approach to sustainable supply and actions being taken to address climate change. Of these suppliers, over 60% have sustainability programs and communicate their progress on sustainability. Ninety percent of our largest energy suppliers have demonstrated their commitment to sustainability through energy efficiency programs and transparency. The company has over 15,000 suppliers globally, which results in the low percentage of suppliers by number.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Impact of engagement, including measures of success</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>
Measure of success
The measure of success for engaging with our suppliers is an increase in the amount of renewable energy we procure or produce.

Impact of engagement
Understanding our suppliers’ commitments to sustainability enables us to identify the companies we should engage on energy projects that can help reduce our GHG emissions. For example, we are working with several suppliers on procuring renewable energy. Air Products France is using renewable electricity from to produce merchant industrial and medical gases and to power its sales and administrative offices. The renewable electricity is validated by the purchase of GO (Guarantee of Origin) certificates from ENGIE that are registered on the National Registry for Guarantees of Origin. Wind power is used in the United Kingdom for our merchant gas production through our partnership with Ørsted (formerly DONG Energy), a global leader in offshore wind power. In addition, we are working with suppliers on opportunities to purchase renewable electricity the U.S. and Europe as well as considering on-site energy generation at several facilities. The efforts have been helpful as we have sought to identify green energy sources that can reduce our energy costs and environmental footprint. In 2019, we increased our purchases and production of renewable electricity, meeting our measure of success and reducing our emissions by 178,000 metric tons of CO2e.

Comment
Air Products does not have reliable data available to estimate Scope 3 emissions attributable to this activity at this time.

C12.1b

(C12.1b) Give details of your climate-related engagement strategy with your customers.

Type of engagement
Education/information sharing

Details of engagement
Run an engagement campaign to educate customers about the climate change impacts of (using) your products, goods, and/or services

% of customers by number
100

% of customer - related Scope 3 emissions as reported in C6.5
0

Please explain the rationale for selecting this group of customers and scope of engagement
At Air Products, we help our customers improve their sustainability performance. Our products enable our customers to be more productive and efficient – to make more with less while reducing their impact on the environment. In 2019, our products enabled our customers and downstream users to avoid the equivalent of 69 million metric tons of carbon dioxide emissions. This figure is 2.5 times our own direct and indirect CO2e emissions.

We provide our customers with information about our products including our sustainable offerings, which are products that can help them improve energy efficiency, reduce environmental impact, and/or address a societal need. For example, hydrogen is a sustainable offering that is used to refine heavier, sour crudes, increase refinery yields and reduce emissions through cleaner transportation fuels including ultralow sulfur diesel fuel and hydrogen powered electric fuel cell vehicles. Air Products’ oxy-fuel combustion technologies are also sustainable offerings and are used in energy intensive applications like cement, metals and glass manufacturing to increase production, lower fuel use and costs, reduce emissions and optimize efficiency.

Sales of gases such as hydrogen and oxygen enhance our bottom line. In fiscal year 2019, sales of atmospheric gases such as oxygen, nitrogen, argon, and rare gases constituted approximately 46% of our consolidated sales. Sales of tonnage hydrogen, syngas, and related products constituted approximately 26% of consolidated sales in fiscal 2019.

Impact of engagement, including measures of success

Measure of success
The measure of success for engaging with our customers is their increasing level of interest in how we can help them achieve their sustainability goals and meeting our sustainable offering revenue goal of 50%.

Impact of engagement
Air Products has been building its business over time with the focus on helping our customers achieve their business outcomes in a more sustainable way – whether that is by increasing productivity, producing better quality products, reducing energy use or lowering emissions. We believe increased customer understanding of Air Products as a sustainable solutions provider has driven new business and created opportunities to innovate with customers as they realize their energy strategies alongside economic growth and social development. In 2019 we saw an increase in customer interest in energy and emissions and particularly how we could help them meet their sustainability goals, consistent with our measure of success.

Each year we estimate the revenues related to products and applications that drive sustainability-related value for our customers and help them improve energy efficiency, reduce environmental impact, or address a societal need. In 2019, 53% of our revenues were derived from these sustainable offerings, exceeding our goal of 50%.

Air Products is unable to reliably estimate Scope 3 emissions from the use of our
products and therefore cannot estimate the percent of Scope 3 emissions related to this engagement.

C12.1d

(C12.1d) Give details of your climate-related engagement strategy with other partners in the value chain.

Where appropriate, Air Products participates in government-mediated forums with major customers where these forums are part of broader consultation processes leading to new environmental policy, for example, in The Netherlands, on the development of the country’s Klimaatakkoord (Climate Accord). Through the vehicle of industrial gases industry associations, Air Products also cooperates with representative associations of customer sectors, such as Phase IV of the Emissions Trading System in the EU. In both cases, we seek to ensure that new environmental legislation is constructed so as to respect the environmental value brought by our business model.

Air Products has also engaged directly with contract hauliers, encouraging them to increase the efficiency of their fleets and consider alternative transportation fuels. Similarly, we have worked with tanker manufacturers to design jumbo trailers for some of our products that can reduce the distance travelled per volume of gas delivered. The measures of success for these efforts are improved fuel efficiency and reduced distribution distances, both of which reduce greenhouse gas emissions. For example, the use of the new trailers improved distribution efficiency by 26%. Overall, these efforts and other distribution-related programs have enabled Air Products to improve distribution efficiency by 18% since 2015 and avoid over 80,000 metric tons of CO2e emissions.

C12.3

(C12.3) Do you engage in activities that could either directly or indirectly influence public policy on climate-related issues through any of the following?

- Direct engagement with policy makers
- Trade associations
- Funding research organizations
- Other

C12.3a

(C12.3a) On what issues have you been engaging directly with policy makers?

<table>
<thead>
<tr>
<th>Focus of legislation</th>
<th>Corporate position</th>
<th>Details of engagement</th>
<th>Proposed legislative solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clean energy generation</td>
<td>Support</td>
<td>As part of the normal legislative process, Air Products directly engages policy makers through consultation and meetings to ensure that developing energy and related policies take appropriate account of the specific</td>

</tr>
</tbody>
</table>
characteristics of renewable energy technology that forms the basis of our investment intentions. As an example of those efforts, Air Products has engaged with the UK government on matters concerning the Renewables Obligation Scheme, and the rollout of the Energy Market Reform policy and attendant regulations.

| Mandatory carbon reporting | Support with minor exceptions | Air Products engages with various agencies on mandatory carbon reporting, particularly the U.S. EPA Greenhouse Gas Reporting Rules (Greenhouse Gas Reporting Rule 40CFR Part 98), California’s Regulation for the Mandatory Reporting of Greenhouse Gas Emissions, Ontario Ministry of the Environment and Climate Change, Alberta Environment and Parks and Environment Canada. The company periodically meets directly with regulatory staff, participates in public regulatory workshops and submits formal and informal comments to regulators. | Air Products seeks to ensure reporting methodologies define reasonable measurement requirements, accuracy expectations and alternatives to address missing data points. |

| Cap and trade | Support with minor exceptions | Through the vehicles of the European Industrial Gas Association (EIGA) and selected European national industrial gases associations, Air Products has responded to consultations and met directly with EU policy-makers to ensure that the role of our industry in achieving the aims of EU environmental policies can more easily and more cost-effectively be achieved. One example of this is policies relating to emissions trading. | Air Products seeks comparable treatment under the regulations (e.g., consistent basis for allocation of free allowances) to all producers, regardless of ownership structure, to not unduly disadvantage the over-the-fence supply model for hydrogen. |

**C12.3b**

(C12.3b) Are you on the board of any trade associations or do you provide funding beyond membership?

Yes
C12.3c

(C12.3c) Enter the details of those trade associations that are likely to take a position on climate change legislation.

Trade association
European Industrial Gases Association

Is your position on climate change consistent with theirs?
Consistent

Please explain the trade association’s position
The European Industrial Gases Association (EIGA) is a safety and technically oriented organization representing the vast majority of European and a number of non-European companies producing and distributing industrial, medical and food gases. EIGA actively promotes safety, health and environmental care through working groups at management and technical expert levels, through the publication of a wide-range of technical literature, and through the organization of conferences and seminars. They provide information and recommendations to local, national and international authorities and organizations for their guidance in the preparation of laws, regulations and standards which are both practical and effective.

How have you influenced, or are you attempting to influence their position?
Member companies of EIGA, including Air Products, closely co-operate in matters concerning production, transport, storage and application to achieve the highest level of safety and environmental care in the handling of gases. EIGA also initiates the development of appropriate standards and provides standardization bodies with technological expertise.

Through EIGA Air Products has responded to consultations and met directly with EU policy-makers to ensure that the role of our industry in achieving the aims of EU environmental policies can more easily and more cost-effectively be achieved.

C12.3d

(C12.3d) Do you publicly disclose a list of all research organizations that you fund?
No

C12.3e

(C12.3e) Provide details of the other engagement activities that you undertake.
Air Products is engaged in many industry associations around the world that have supportive environmental positions. These include, but are not limited to, the Fuel Cell and Hydrogen Energy Association (FCHEA), Hydrogen and Fuel Cell Technical Advisory Committee (HTAC),
the Hydrogen Council and the National Alliance of Hydrogen and Fuel Cell organization (NAHFC).

**C12.3f**

(C12.3f) What processes do you have in place to ensure that all of your direct and indirect activities that influence policy are consistent with your overall climate change strategy?

Air Products’ regional environmental specialists and Government Relations Team members provide expertise for matters related to greenhouse gases and climate change including internal policy development, regulations, and legislation. These experts contribute to and are aware of Air Products’ position and goals related to greenhouse gases and climate change, which are articulated on our website, in our annual Sustainability Report, and through employee electronic communications. The experts also share information and best practices across regions to promote consistent approaches to climate change developments. In addition, all employees must follow Air Products’ Code of Conduct and Business Ethics, which notes that it is the responsibility of every employee to protect our company by conducting ourselves in strict compliance with the letter and spirit of the Code, as well as with all applicable laws.

**C12.4**

(C12.4) Have you published information about your organization’s response to climate change and GHG emissions performance for this reporting year in places other than in your CDP response? If so, please attach the publication(s).
